Poke App - Team 1 Milestone #7
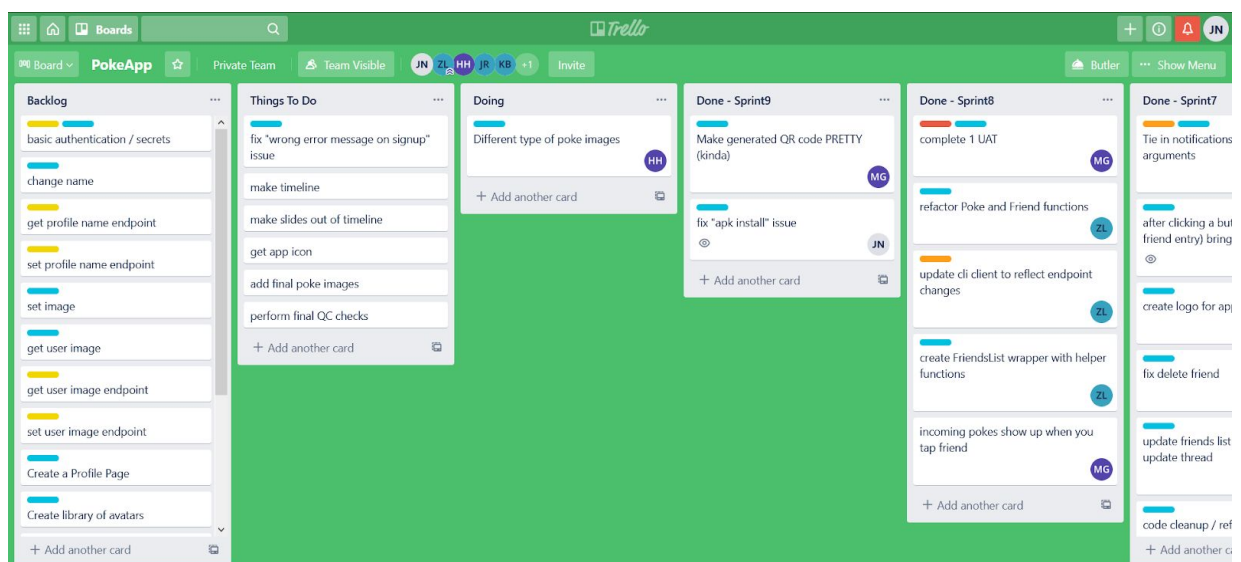

Title of Project (app):

Poke!

Project Description:

Messaging app to send friends images with limited text (pokes). Android application that can be downloaded via apk file. After downloading the app, the user will register by creating an account upon launching the app and are given a randomly generated personal UUID and QR code. They will also be prompted to add friends as they should have none after registering. And so others who also have the app can add each other by scanning QR codes. After scanning friends there will be a friends list that displays all of the users friends and allows the user and their friends to send pokes to each other by tapping the friend and choosing a type of poke. Should the user no longer wish to receive pokes from a specific friend they can remove them by holding on to the friend user in their friends list. Finally, account is tied to the device and should the user erase the app the account is no longer available for use.

⋮

Merge branch 'master' into Jackson

Merge pull request #4 from CSCI-3308-CU-Boulder/Jackson

Update README.md

Deployment:

The app can be accessed and used by downloading the APK file in the most recent GitHub Release on Android. Once downloaded and installed, the user can launch the application and register, add friends, poke, etc.
